

# PULMICORT (Budesonide): Prevents Wheezing, Shortness of Breath, and Troubled Breathing Caused by Severe Asthma and other Lung Diseases

Although, your health condition may impact your everyday life, do not let it define who you are. PULMICORT (budesonide) is used to help prevent the symptoms of asthma. When used regularly every day, inhaled budesonide decreases the number and severity of asthma attacks. However, it will not relieve an asthma attack that has already started. Budesonide is a corticosteroid or steroid (cortisone-like medicine). It works by preventing inflammation (swelling) in the lungs, which make the asthma attack less severe. Inhaled budesonide may be used with other asthma medicines such as bronchodilators, which are also used to open up narrowed breathing passages in the lungs. This medicine is available only with your doctors prescription. Thanks and may you have a good understanding about this drug PULMICORT (budesonide). You may want to share this book with your family and friends who may be in need of help and would want to use this medicine. Take care, and as always, be well!
